

Manaaki Health: design iteration (Milestone 2)

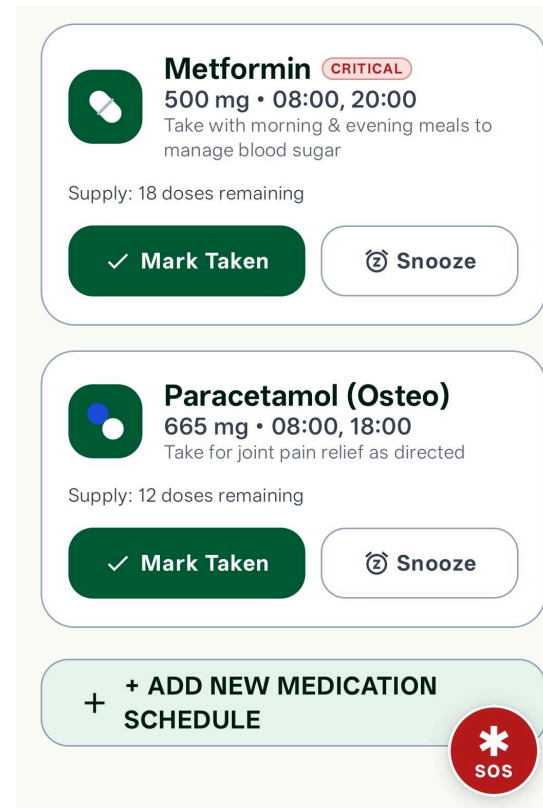

COMP826 Mobile Systems Development. UI/UX role.

Student: Darshilkumar Mathukiya | Student ID: 26344058 | Date: 05/10/2026

This document records the interface changes made during Milestone 2. Each change was found by reviewing the running app on a OnePlus Nord 5, fixed in code, and checked again on the same phone. Before and after screenshots are shown side by side. Each change has a matching commit in the repository.

No	Change	Screens affected	Commit
1	SOS button covered content	Medication (and other scrolling screens)	5c7c386
2	Button labels cut or split across lines	Medication	5e6ac0a
3	Sign-in screen did not fit the screen	Sign in	47498f2
4	Vitals chip and legend squeezed	Vitals	55c3ad9
5	Consistent names across screens	Home, Care, SOS	7ae64de
6	Navigation redesign	All screens	60dbb97

Change 1: SOS button covered content

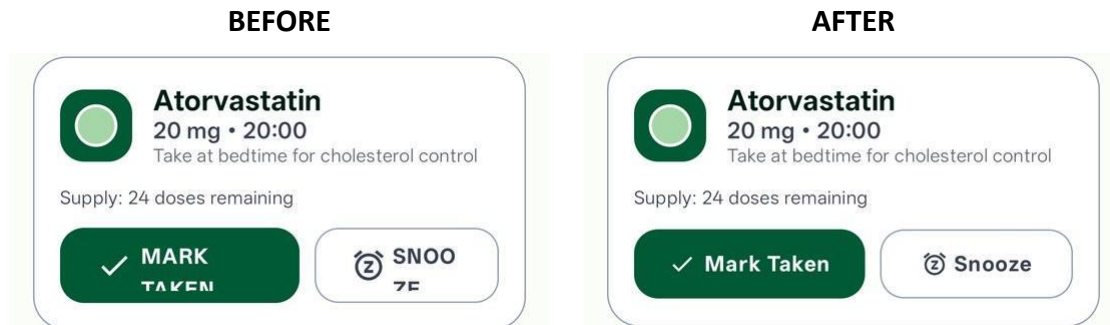

Problem: The floating SOS button hid part of the content on five screens. On the medication screen, it covered the Snooze button.

Why it matters: A user couldn't reach a control, and emergency help shouldn't block everyday tasks.

Change made: Added extra bottom padding to every scrolling screen so content can be scrolled clear of the button.

Commit: 5c7c386, SOS button covered content

Change 2: Button labels cut or split across lines

Problem: Labels such as Snooze and Mark Taken broke across lines or were clipped at the bottom of the button.

Why it matters: Older adults often use larger system text, and unreadable labels cause errors.

Change made: A shared button that grows with its text replaced the fixed-height buttons. Mark Taken and Snooze now fit on one line on the Medication screen.

Commit: 5e6ac0a, Button labels cut or split across lines

Change 3: Sign-in screen did not fit the screen

Register

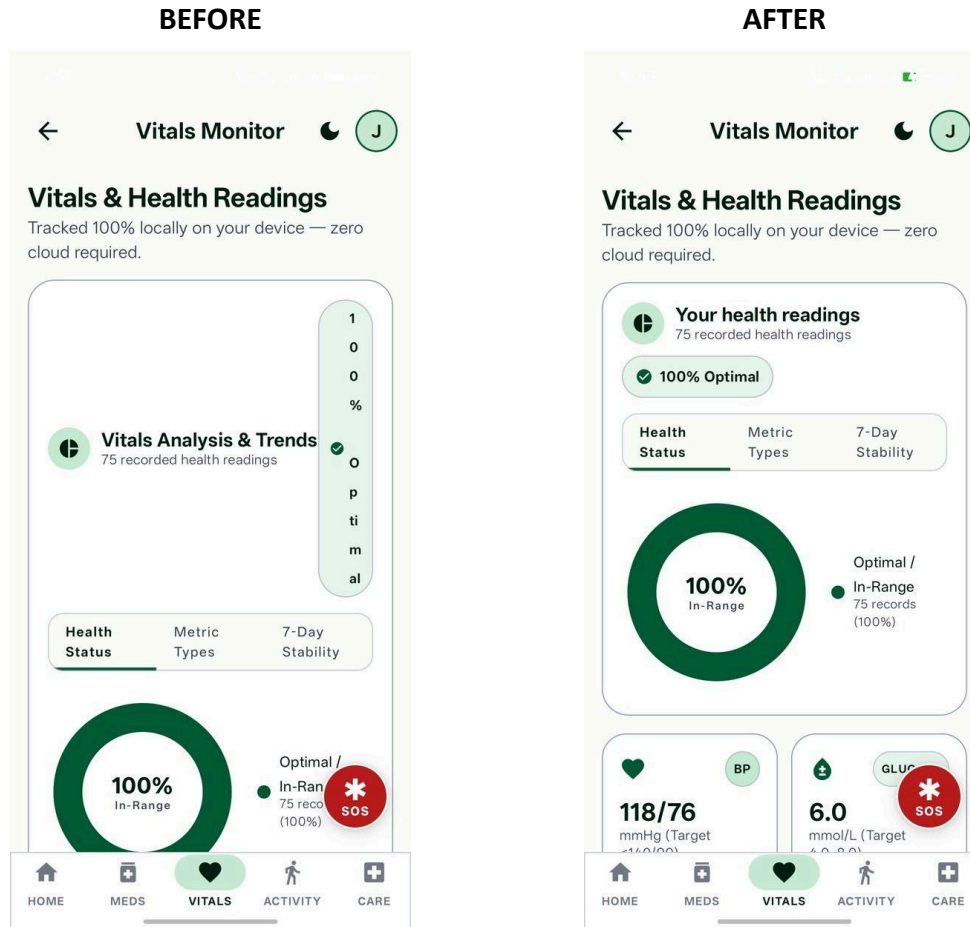

Problem: The Register button text was split in two, the bottom card was cut off, and the logo touched the top edge.

Why it matters: The first screen must work on every phone size, with the keyboard open, and at larger text sizes.

Change made: The layout was rebuilt so everything fits, the Register button sits on its own row, and the Caregiver label is shortened to fit on one line. The demo account replaces a real-looking email.

Commit: 47498f2, Sign-in screen did not fit the screen

Change 4: Vitals chip and legend squeezed

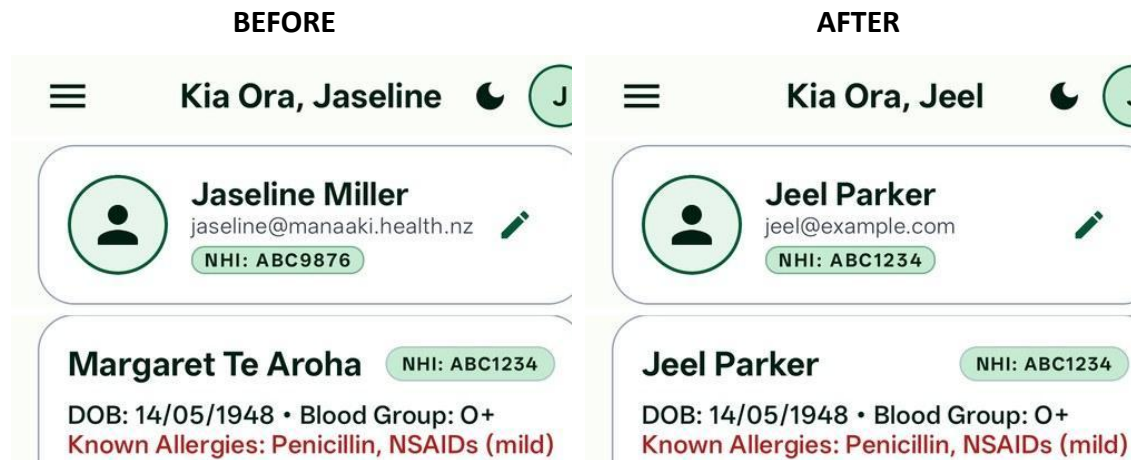

Problem: The "100% Optimal" chip wrapped one letter per line, and the legend text was cut ("In-Ran").

Why it matters: The key health message was unreadable.

Change made: The chip now sits on its own row under the title and the legend has room to wrap. The card title uses plainer wording: "Your health readings".

Commit: 55c3ad9, Vitals chip and legend squeezed

Change 5: Consistent names across screens

Problem: Different names and numbers appeared on different screens. Top to bottom: the Home greeting and the Care profile showed Jaseline (NHI ABC9876), while the SOS Medical ID showed Margaret Te Aroha (NHI ABC1234).

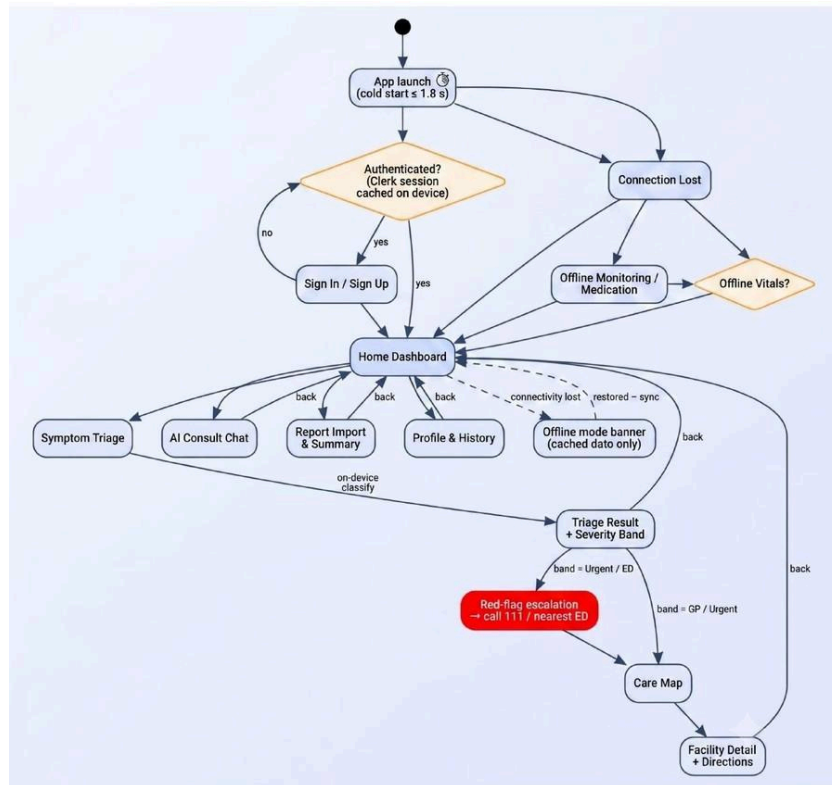

Why it matters: Mismatched details look like errors, and in an emergency the Medical ID must match the signed-in person.

Change made: All names now come from one sample-data file. Home, Care, and SOS show Jeel Parker with the same NHI, and Jaseline Miller appears as the caregiver.

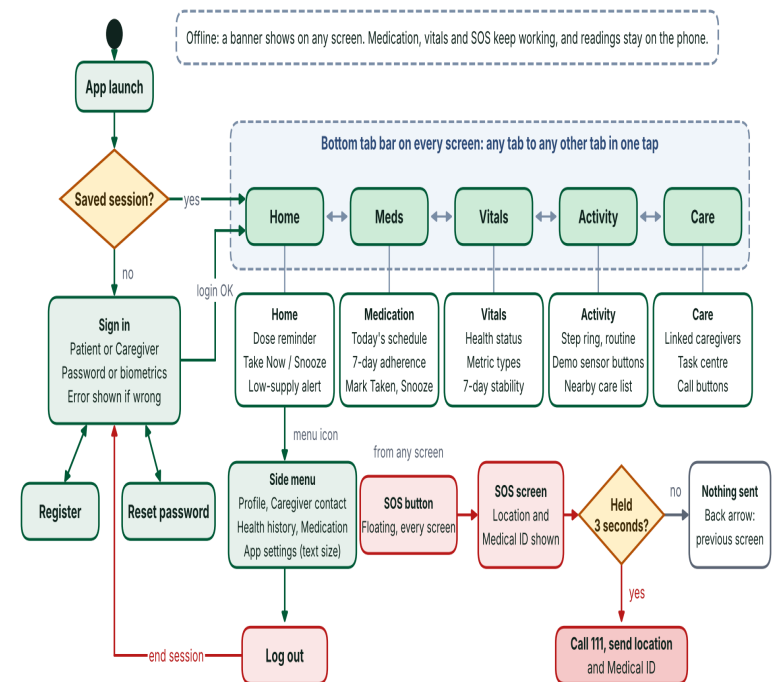

Commit: 7ae64de, Consistent names across screens

Change 6: Navigation redesign

BEFORE (Milestone 1 graph)

AFTER (Milestone 2 graph)

Problem: The Milestone 1 navigation graph had two "yes" exits from "Authenticated?", one exit from "Offline Vitals?", and no logout.

Why it matters: Every decision needs a clear way out, and users need a visible way to log out.

Change made: The session check now has one yes and one no. The offline state is a banner, not a decision. Log out returns to Sign in. The SOS flow shows that releasing the button early sends nothing.

Commit: 60dbb97, Navigation redesign
